;; Edited 17-Mar-2022 12:05 by rmk: NIL in EXTENSIONS matches no-extension

;; Edited 17-Feb-2022 23:15 by larry

;; Edited 8-Dec-86 17:57 by bvm

;; Search for FILE on the directories contained in DIRLST (or DIRECTORIES), where NIL and T refer to the login and connected dirs, respectively.

;;; On each directory, prefer files having extension found in EXTENSIONS in the indicated order.

;;; If FILE already has an extension, EXTENSIONS is ignored.

;;; If FILE already has a host/dir, DIRLST is ignored, only FILE's directory is considered.

;;; For a file FOO or FOO-FIE, then for each directory DIR in DIRLST, DIRLST is interpreted also as including DIR>FOO.

  [LAMBDA (STREAM FILECREATEDFN RETURNFORM INITIALENV)   ; Edited 17-Jul-2021 21:26 by rmk:

;;; Parses the stuff at front of STREAM, which is assumed positioned at zero, and returns as its first value a reader environment for the file, or NIL if this
;;; is not a Lisp source file.

;;;
```

```
;;; The header information that it processes consists of an optional DEFINE-FILE-INFO expression followed by a single FILECREATED expression.
;;; That is, if there are 2 filecreated expressions, as for compiled files, it only gets the first one.

;;;

;;; If a FILECREATED expression is found, then calls FILECREATEDFN with the file pointer positioned immediately after the symbol FILECREATED,
;;; and returns the fn's value as its second value.

;;; FILECREATEDFN = RETURN returns the entire FILECREATED expression.

;;; Finally, in the case where no FILECREATED expression was found, returns as second value the actual first expression if RETURNFORM is true (this
;;; is needed for callers that don't want to lose when the stream is non-randaccess).

;;; The first expression on the file is read in the current reader environment.  Usually this wants to be IL.
