

:: Test File for Function: oddp
:: Source: Steel's Book, Chapter 12, Section 2, page 196
:: Created by: John Park **:: Creation Date:** May 1, 86
:: Predicate: The oddp predicate is true if integer is odd and otherwise false.
:: Syntax Format: (oddp integer)
:: Input: odd integer
:: Output: T or NIL

```
(do-test oddp-test
  (and (oddp 3)
        (oddp -7)
        (not (oddp 0))
        (not (oddp 4))
        (not (oddp 3.0))
        (not (oddp -3.0)))))
```
