 (COMS (* * Classes and methods for perspectives - A group of objects can be associated together as
  different perspectives of the same thing. This is implemented by having them all point to a
  Node instance which has all the associated objects on a property list of the variable
  perspectives. Each object has a perspective name
  (unique in the associated group, but perhaps used in many groups)
  that is used to identify it by the other objects. The user does not need to see the
  perspectiveNode, but can simply get from one object to another by means of the message GetPersp
  with argument perspName.)
