          (* * This is the universe's worst known hack. Whoever wrote ATTACHEDWINDOW put hard constants into the
          ATTACHWINDOW fn which get inserted into the PASSTOMAINCOMS prop of attached windows.
          This should be a var so that we can tell it what messages to pass or not in a general case.
          This function creates an attached window and (you'll love this) smashes the prop's value so that the const in the
          ATTACHWINDOW function is smashed so that everything works pretty generally.
          Yuko!!!)
