;;; SCANFILE0 returns a 'map' for the file. The form of the map is (ADR ADRLST ADRLST ...) where ADR is last address scanned to in file, or NIL if
;;; entire file was scanned, or (ADR) where the scan stopped after a function in the middle of a DEFINEQ. Each ADRLST is either of the form (ADR1
;;; ADR2 . FN) or (ADR1 ADR2 (FN ADRX . ADRY) (FN ADRX . ADRY) ...).

;;; The first case corresponds to a compiled function, the second to a DEFINEQ. In the first case, ADR1 is the address of the first character AFTER the
;;; function name in the file (for use by LAPRD) and ADR2 the address of the first character after the de definition, i.e., after LAPRD or LCSKIP has
;;; finished.

;;; In the second case, ADR1 is the address of the lef paren before the DEFINEQ, and ADR2 either the address of the first character after the entire
;;; DEFINEQ expression, or the address of the first chracter after the last function that was scanned. In (FN ADRX . ADRY), ADR is the address of of the
;;; left parentheses before the function name, ADRY the address of the character after the right paren that closes the definition.

;;; A map of non-functions is not kept because (a) it would not be of use to MAKEFILE since it always recomputes VARS, and (B) most requests for other
;;; than functions require scanning the entire file anyway, e.g. to find all RPAQQ's, and (C) the expressions are usually small compared to DEFINEQ's.

   ;; Double check. the SOME is because of the (admittedly obscure but it happens) case where there are DEFINEQ's inside of a DECLARE:.. in
   ;; this case, they would appear on the filemap, but DICT0 would not have been stepped because the DEFINEQ's would not have been seen in the
   ;; scan. Now we know that CAR of DICT0 corrresponds to this DEFINEQ. We process DEFINEQ's the same when there are functions to be
   ;; found, i.e. when FNLST is non-NIL, as when there aren't any, on the grounds that it takes about as long to do many little SKREAD's as one big
   ;; SKREAD, and this way we also get to build the map.

```
          [COND
              ((CADAR DICT0)
```
               ;; This entire DEFINEQ was scanned, and ADR is the address of the first character after it. Move file pointer and go on, i.e. dont have
               ;; to do SKREAD. Note that this applies even if we are looking for functions, i.e. FNLST not NIL, because in this case all functions of
               ;; interest would have been picked up by SCANFILE1.

```
               (SETFILEPTR NIL (CADAR DICT0))
